

Sprint Review – Sprint 4

Sprint 4 focused primarily on refinement, stabilization, documentation improvements, and final presentation readiness for the CampusBites platform. By this stage, the majority of the system's core functionality had already been completed, allowing the team to focus mainly on improving usability, consistency, workflow refinement, deployment validation, and overall professionalism before final submission.

During the sprint review session, the tutor was generally satisfied with the progress demonstrated by the team and acknowledged that the platform had become significantly more polished and presentation-ready compared to earlier demonstrations. The tutor reviewed several refinements and integrated workflows across the platform, particularly focusing on data consistency, usability improvements, and the professionalism of the overall system.

Several refinements and improvements demonstrated during the review included:

- Vendor and customer dashboard refinements
- Improved order-management workflows
- Daily order-number logic improvements
- Vendor storefront and profile refinements
- Navigation and UI consistency improvements
- Improved customer/vendor branding and responsiveness
- Firebase integration and deployment validation
- Review-system refinements and vendor discoverability improvements
- Notification and feedback refinements
- Finalized allergen-selection workflow using standardized templates

A major discussion point during the review involved data integration and standardization. The tutor specifically requested that allergens should not be manually entered freely by vendors, but instead selected from a standardized predefined list/template to ensure consistency and cleaner data handling across the platform. The team implemented this refinement to improve reliability and maintain better structured menu-item data.

The tutor also requested more detailed and integrated UML/system diagrams within the documentation. Feedback indicated that diagrams needed to better demonstrate relationships and interactions between system components rather than showing isolated structures. As a result, the team identified additional documentation refinements that would improve the clarity and professionalism of the final submission.

Another important part of the sprint review involved a live demonstration of certain UI functionality. The tutor requested a live demonstration of the filtering/color customization functionality during the review session. Although the feature initially required troubleshooting during the demo, the team successfully resolved the issue and completed the demonstration successfully.

Overall, Sprint 4 was considered successful. The team significantly improved the stability, usability, professionalism, and presentation readiness of CampusBites while addressing refinement feedback from both the tutor and external usability testing. The final remaining focus areas primarily involve polishing documentation, refining diagrams, resolving minor integration issues, and preparing the platform for final submission and demonstration.
